

## Narrative Report

This narrative report is entirely about my internship at iPhiTech IT Digital Solutions Corporation. I'm Joseph Barredo, a graduating student from Bulacan State University Sarmiento campus who is pursuing a Bachelor of Science in Information Technology. I will talk about all the knowledge and skill that I gained from the said internship program, as well as the difficulties that I had while doing my daily tasks as an intern as assigned by my mentor and prefect.

My internship at iPhiTech IT Digital Solutions began on the first day of the week, March 28, 2022. We began our first day, like with other firms, with orientation. Mr. Jeri Cantilero, a corporate representative, briefed us on the firm's policies, do's and don'ts, and our obligations as interns. He also tells us the background of the company, after that he introduces us to our prefect and mentor. Following the orientation, we started our first task. The task is creating a landing page with more than 10 complex sections using pure Cascading Style Sheets (CSS) and Hypertext Markup Language (HTML). We only have 24 hours or 3 internship days to complete the task. I struggle with the task since I haven't been able to utilize pure HTML and CSS for a long period of time. However, I managed to finish the task.

They introduced us to Wordpress for our second task. I built a landing page with five sections once more using Elementor, a popular Wordpress website builder. Creating a landing page in Elementor is quick and straightforward because everything is draggable and no hard coding is required. However, you cannot completely customize the style and it is slow on my device, so I struggle to use the Elementor builder. Yet, on the day of task submission, I completed my task. Before the week officially ends, I am required to submit my weekly video report to the company, summarizing my week's experience. And that concludes the first week of my internship.

My second and third week tasks are mostly about design. They handed us a Photoshop intermediate to advanced task as well as a Canva activity. I had no trouble completing the task because I was already familiar with Photoshop and Canva. These two weeks are also jam-packed with game activities to keep us entertained, such as family feud and movie night.

In weeks 4, 5, and 6, I continued to receive web development tasks involving Wordpress with the Elementor builder and Oxygen builder plugins, landing pages with mobile responsiveness utilizing pure CSS and HTML, Javascript training utilizing the freecodecamp website, and basic PHP training involving the creation of a Create, Read, Update, and Delete (CRUD) system. In the remaining week of my internship, our lead requested me to move from day to night shift. Where I was assigned more client-related tasks. The first task was to build a six-page website for a client using Wordpress and the

Gutenberg builder. I struggle with the task due to the builder's unfamiliarity, a lack of customization, and the low spec device I have. The remaining tasks include fixing various aspects of the website known as Quality Assurance (QA), as well as some Shopify tasks. Working at night is challenging for me, but I've got used to it.

This brings my internship experience to a close. Working on iPhiTech is difficult and at times stressful. They gave us real-world job experience to help us prepare for when we graduate. The drawback of this company is that we are not their priority, and they took too long to sign our school papers, such as our weekly report. But I appreciate them accepting us since I learnt a lot and their internship program allows me to improve my skills.
